

Traditional RAG vs Hybrid GraphRAG

What changes when routing, graph facts, and decision support join vector retrieval.

Traditional RAG

1. Embed query

Turn text into a vector

2. Retrieve chunks

Find similar documents

3. Generate answer

LLM writes from retrieved context

Common limitation

Relationships and policy boundaries can be implicit

Hybrid GraphRAG

1. Use memory

Conversation-aware query handling

2. Route intelligently

Brain Router selects KG, RAG, Hybrid, Decision

3. Retrieve from specialists

Neo4j facts + Qdrant sources + Decision API

4. Synthesize safely

Gemma primary, Gemini backup, fallback

5. Explain result

used_facts, graph payload, missing_information
